

## Applications: Geometry (Lines and Triangles)

<p><b>Parallel</b> lines: Two lines in the same plane that do not intersect</p> 	<p><b>Perpendicular</b> lines: Two lines that intersect at right angles.</p> 	<p><b>Acute</b> triangle: A triangle in which all three angles are acute.</p> 	<p><b>Equilateral</b> triangle: A triangle with all three sides of equal length. (Each angle will be <math>60^\circ</math>.)</p> 
<p><b>Obtuse</b> triangle: A triangle that contains one obtuse angle</p> 	<p><b>Isosceles</b> triangle: A triangle that has two sides of equal length.</p> 	<p><b>Right</b> triangle: A triangle that contains one right angle.</p> 	<p><b>Scalene</b> triangle: A triangle that has no sides of equal lengths.</p> 

Remember, the **sum** of the three angles within a triangle is  $180^\circ$ .

Find the measure of the missing angles in:

Find the measure of the missing angles in:

The measure of the second angle of a triangle is four times the measure of the first angle. The measure of the third angle is 5 degrees more than twice the measure of the first. Find the measures of the three angles.
